**What Kinds and Amounts of Causal Knowledge
Can Be Acquired from Text
by Using Connective Markers as Clues?**

INUI Takashi INUI Kentaro MATSUMOTO Yuji

Nara Institute of Science and Technology (NAIST), Japan

Background & Research goal (1/2)

- To achieve intelligent machines, we require large amounts of several types knowledge.
- In previous research (e.g. [Lenat1995][Stork1999]), **much of the knowledge is constructed manually**. It is costly due to the scale of required knowledge.
- **Automatic knowledge acquisition from document collections**

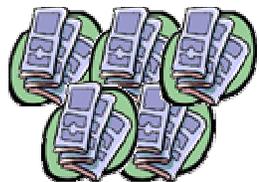

Background & Research goal (2/2)

- Knowledge acquisition of **causal relations**
 - Refer to **an event that causes another event**

Someone is thirsty \Rightarrow Someone Drinks water

It rains hard \Rightarrow Flooding occurs

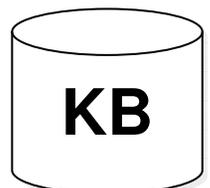

- Key idea : use **connective markers** as clues

The laundry dried well because it was sunny.

It is sunny \Rightarrow

The laundry dries well

Outline of presentation

First part : introduction

- Example
- Typology of causal relations

Second part : technical issues

- Key idea & its problem
- Analyses & Experiments

Outline of presentation

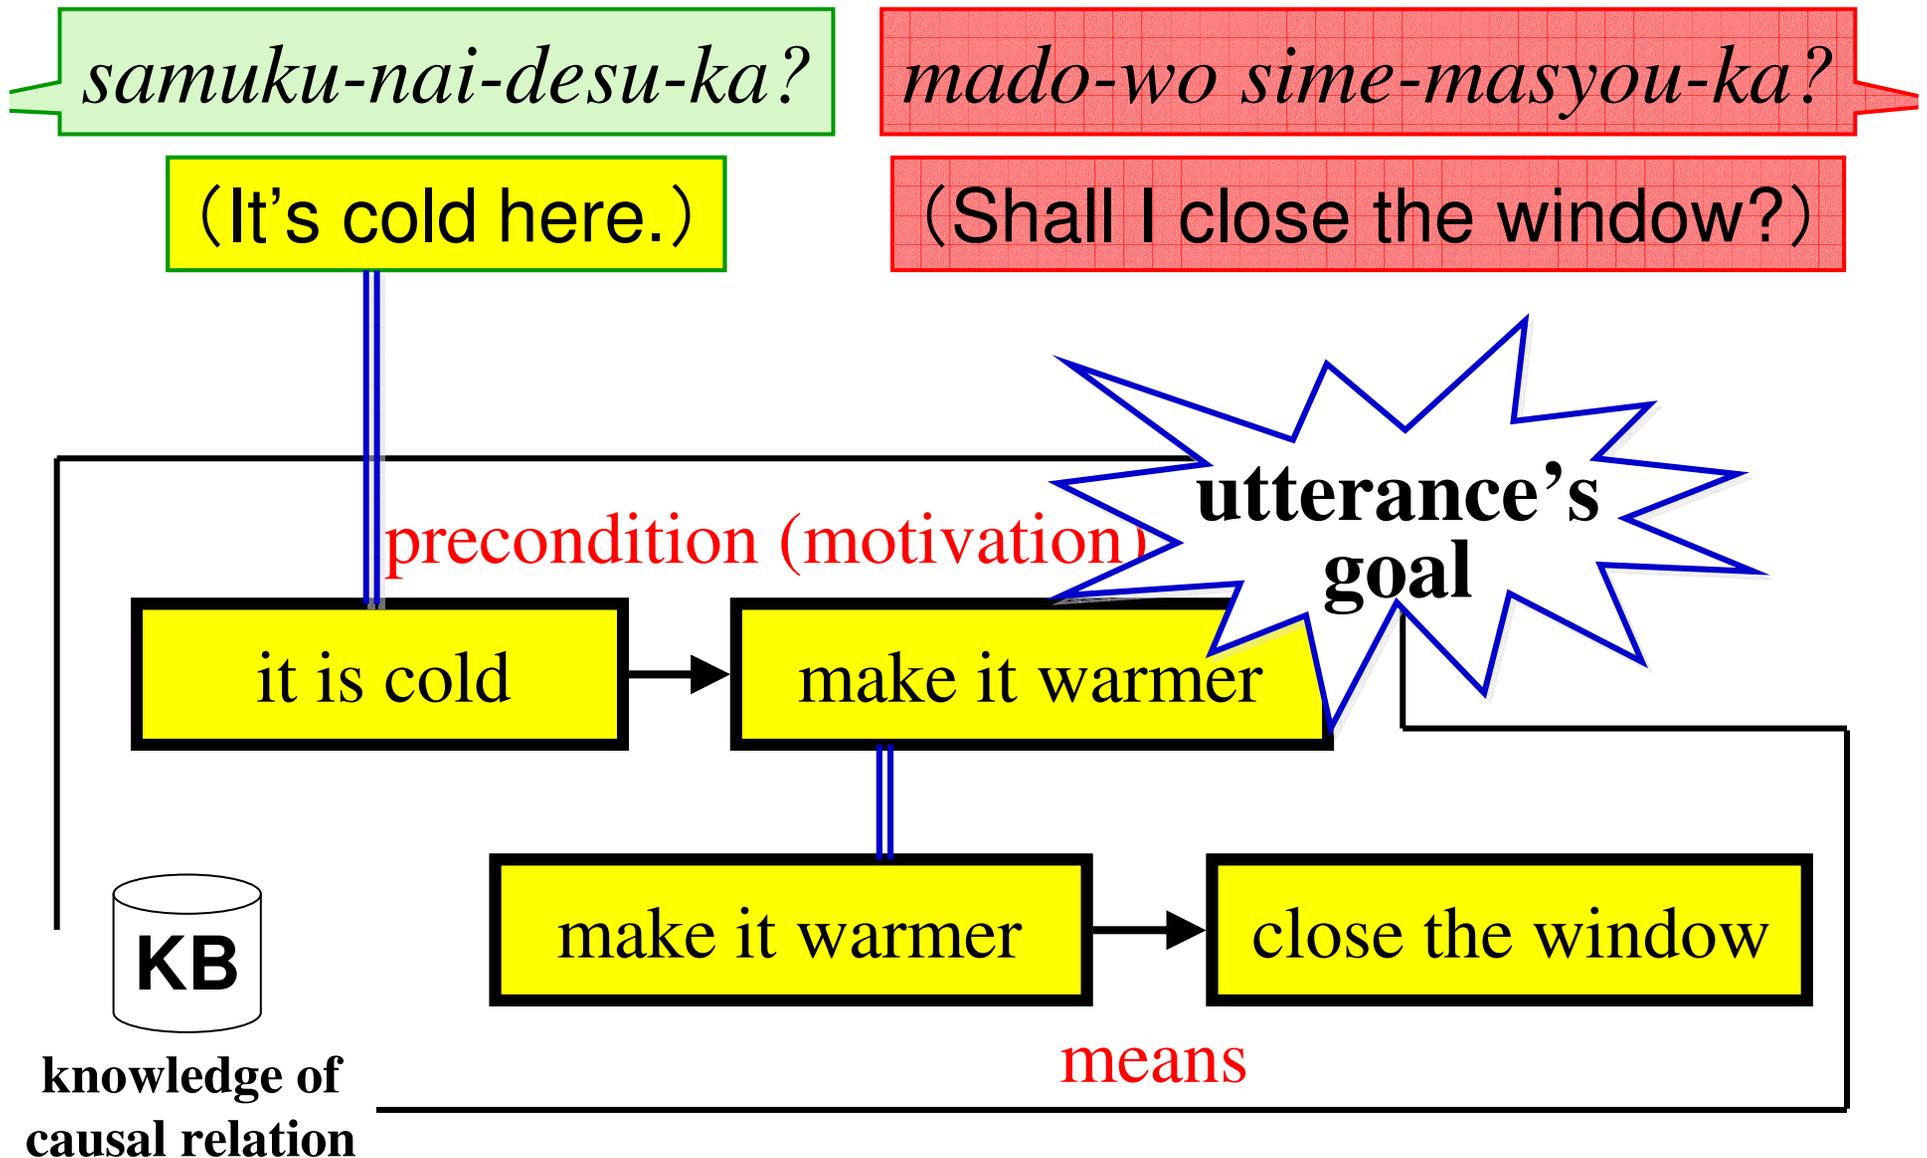

First part : introduction

- Example
- Typology of causal relations

Second part : technical issues

- Key idea & its problem
- Analyses & Experiments

Example of utterance understanding

Typology of causal relations (1/5)

- Acquire 4 types of causal relations between 2 events following [Allen 1995]

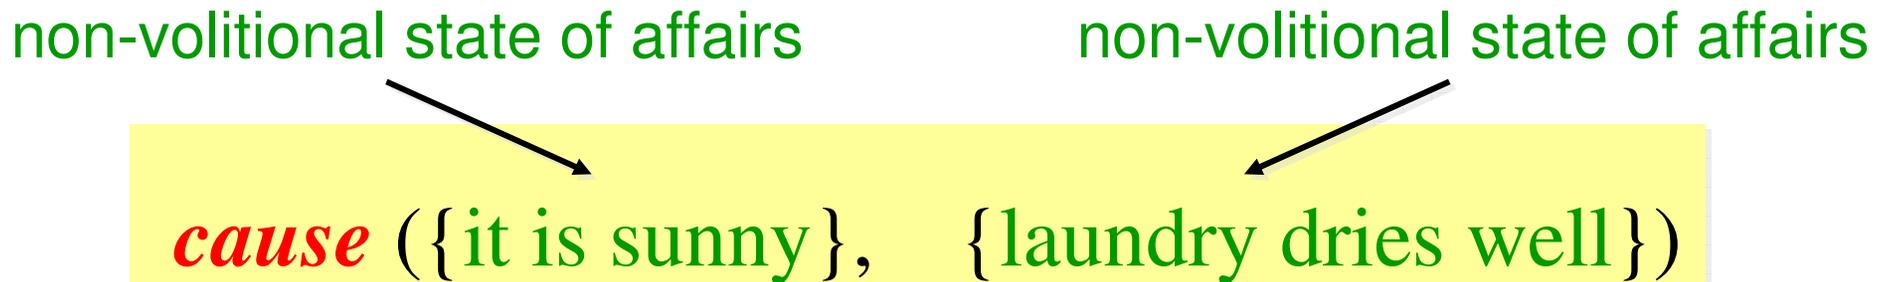

cause effect precondition means

Typology of causal relations (2/5)

- *cause* relation -

non-volitional state of affairs

non-volitional state of affairs

cause ({it is sunny}, {laundry dries well})

Typology of causal relations (3/5)

- *effect* relation -

agent's volitional action

effect ({ someone destroys mangrove swamps },
{ flooding occurs })

The diagram shows a yellow rectangular box containing the text '*effect* ({ someone destroys mangrove swamps }, { flooding occurs })'. An arrow points from the text 'agent's volitional action' above to the first set of curly braces. Another arrow points from the text 'non-volitional state of affairs' below to the second set of curly braces.

non-volitional state of affairs

Typology of causal relations (4/5)

non-volitional state of affairs

precond ({ someone has a driving license },
{ someone drives a car })

The diagram shows a yellow rectangular box containing the text '*precond* ({ someone has a driving license }, { someone drives a car })'. An arrow points from the text 'non-volitional state of affairs' above to the first set of braces. Another arrow points from the text 'agent's volitional action' below to the second set of braces.

agent's volitional action

agent's volitional action

means ({ someone goes to the ticket office },
{ someone buys a ticket })

The diagram shows a yellow rectangular box containing the text '*means* ({ someone goes to the ticket office }, { someone buys a ticket })'. An arrow points from the text 'agent's volitional action' above to the first set of braces. Another arrow points from the text 'agent's volitional action' below to the second set of braces.

agent's volitional action

Typology of causal relations (5/5)

Act : agent's volitional action

SOA : non-volitional state of affairs

<i>Causal_rel</i> (arg1, arg2)	example
<i>cause</i> (<u>SOA</u> , <u>SOA</u>)	<i>cause</i> ({it is sunny}, {laundry dries well})
<i>effect</i> (<u>Act</u> , <u>SOA</u>)	<i>effect</i> ({someone destroys mangrove swamps}, {flooding occurs})
<i>precond</i> (<u>SOA</u> , <u>Act</u>)	<i>precond</i> ({someone has a driving license}, {someone drives a car})
<i>means</i> (<u>Act</u> , <u>Act</u>)	<i>means</i> ({someone goes to the ticket office}, {someone buys a ticket})

necessary condition

sufficient conditions described later

Outline of presentation

First part : introduction

- Example
- Typology of causal relations

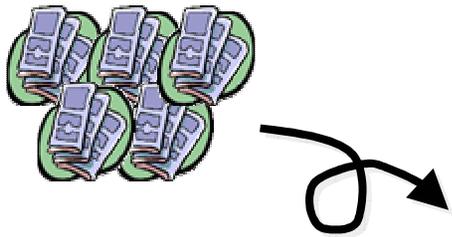

Second part : technical issues

- Key idea & its problem
- Analyses & Experiments

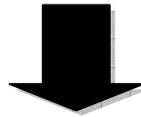

Note: this research was conducted
using **Japanese** newspaper articles

Key idea

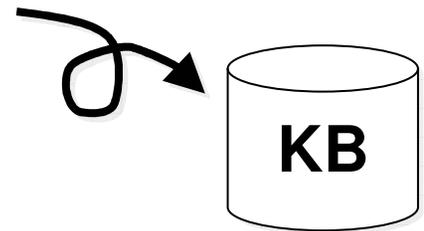

- Use **connective markers** as clues

The laundry dried well today because it was sunny.

cause ({it is sunny}, {laundry dries well})

Problem

- Different types of causal relations are expressed with the same marker.

The laundry dried well today because it was sunny.

➔ *cause* ({it is sunny}, {laundry dries well})

We need to create a computational model to identify which type of causal relation can be acquired from a given sentence.

➔ *means* ({Mary uses a tumble dryer}, {she dries the laundry quickly})

Procedure

Step 1 Select markers.

Step 2 Evaluate marker's effectiveness.

Step 3 Identify the causal relations automatically.

Procedure

Step 1 Select markers.

Step 2 Evaluate marker's effectiveness.

Step 3 Identify the causal relations automatically.

Step 1

Step 1

- Selected *tame* as our target
 - Used frequently and
 - Typically used to express causal relations

marker		freq.
<i>ga</i>	(but)	131 164
<i>tame</i>	(because)	76 087
<i>to</i>	(when/if)	56 549
<i>reba</i>	(if)	48 606
<i>nagara</i>	(while)	13 796

<i>kara</i>	(because)	10 209
<i>node</i>	(because)	9 994
<i>nara</i>	(if)	7 598
<i>tara</i>	(if)	6 027
<i>noni</i>	(but)	2 917

From Nihon Keizai Shimbun issued 1990

Example sentences

Step 1

【Ex.1】

manguroubu-wo *hakaisi-ta*-*tame*

mangr ↑ ACC destroy-PAST-*tame*

subordinate clause
matrix clause

suigai-ga *hasseisi-ta*

flooding-NOM occur-PAST

【Ex.2】

kippu-wo *kau*-*tame* *kippu-uriba-ni* *i-tta*

ticket-ACC buy-*tame* to ticket office go-PAST

Example sentences

Step 1

【Ex.1】

manguroubu-wo *hakaisi-ta-tame*
mangrove-ACC destroy-PAST-tame

suigai-ga *hasseisi-ta*
flooding-NOM occur-PAST

【Ex.2】

kippu-wo *kau-tame* *kippu-uriba-ni* *i-tta*
ticket-ACC buy-tame to ticket office go-PAST

Procedure

Step 1 Select markers.

We used “tame”

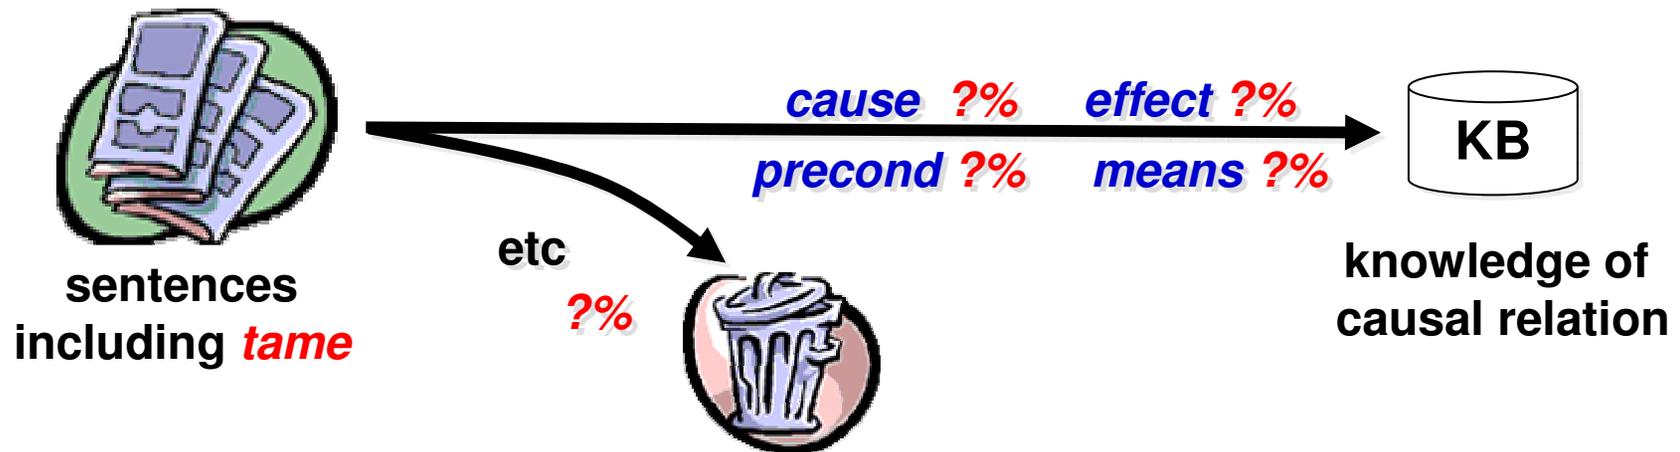

Step 2 Evaluate marker's effectiveness.

Step 3 Identify the causal relations automatically.

Step 2

Step 2

- Evaluate effectiveness of *tame*
 - How many causal relation instances are expressed by sentences including *tame*?

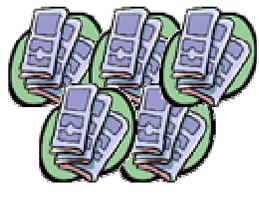

- Manually classified samples
 - Sample: about 1000 sentences including *tame*
 - Using linguistic tests

Linguistic tests (1/3)

Step 2

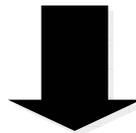

1. Translate sentence to **two base-form items**.

- Some modal information (tense, passive voice, etc.) is deleted.

past

Flooding occurred **because**
mangrove swamps **were destroyed**.

passive voice

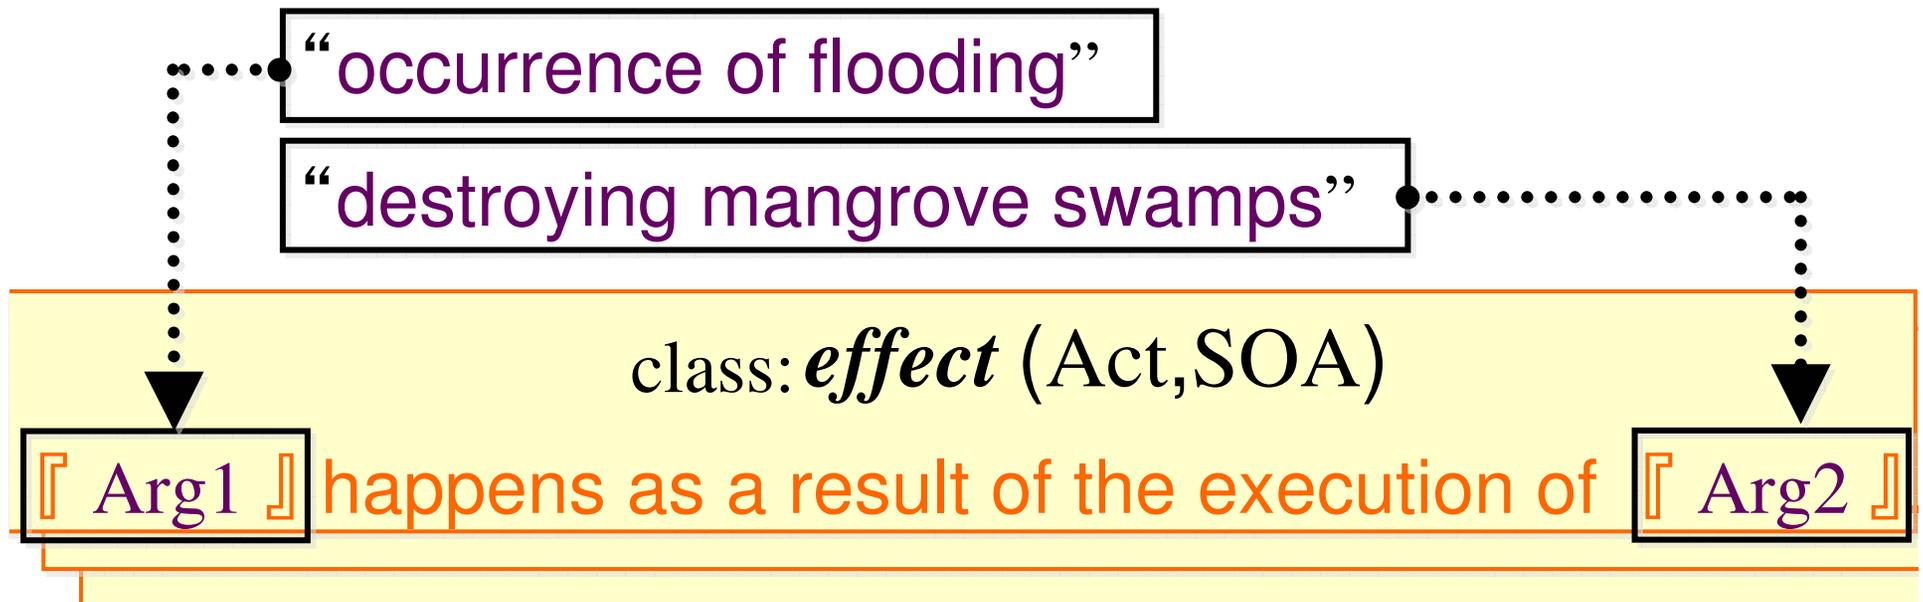

“occurrence of flooding”

“destroying mangrove swamps”

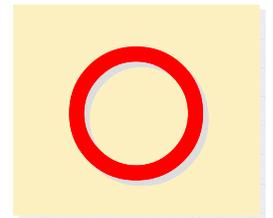

Linguistic tests (2/3)

Step 2

2. Embed **items** in the **slot** of the **template** to form a candidate sentence

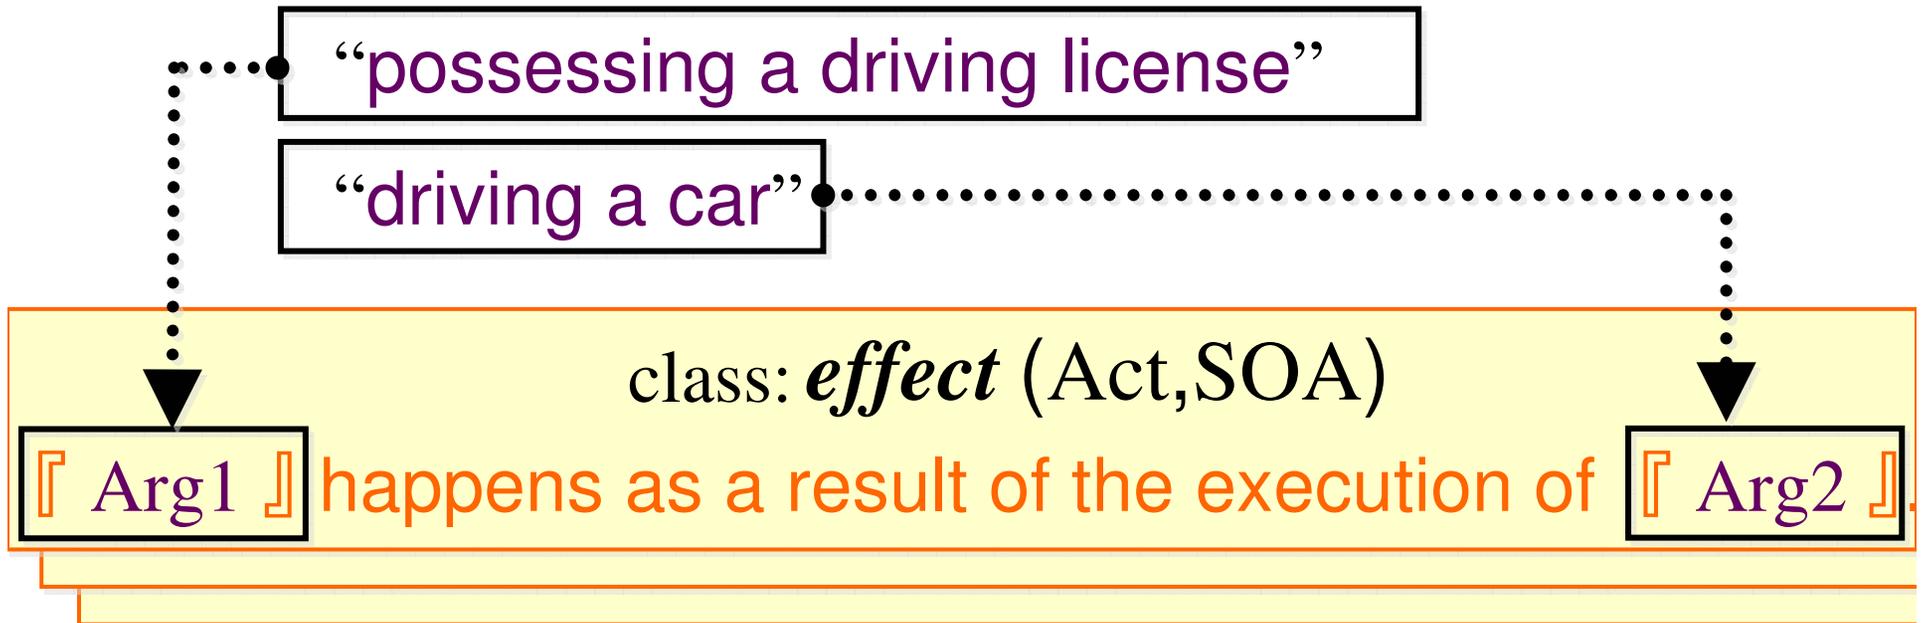

3. If the candidate sentence has the correct meaning, we identify the relation as belonging the class (*effect*)

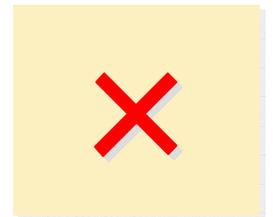

Linguistic tests (3/3)

Step 2

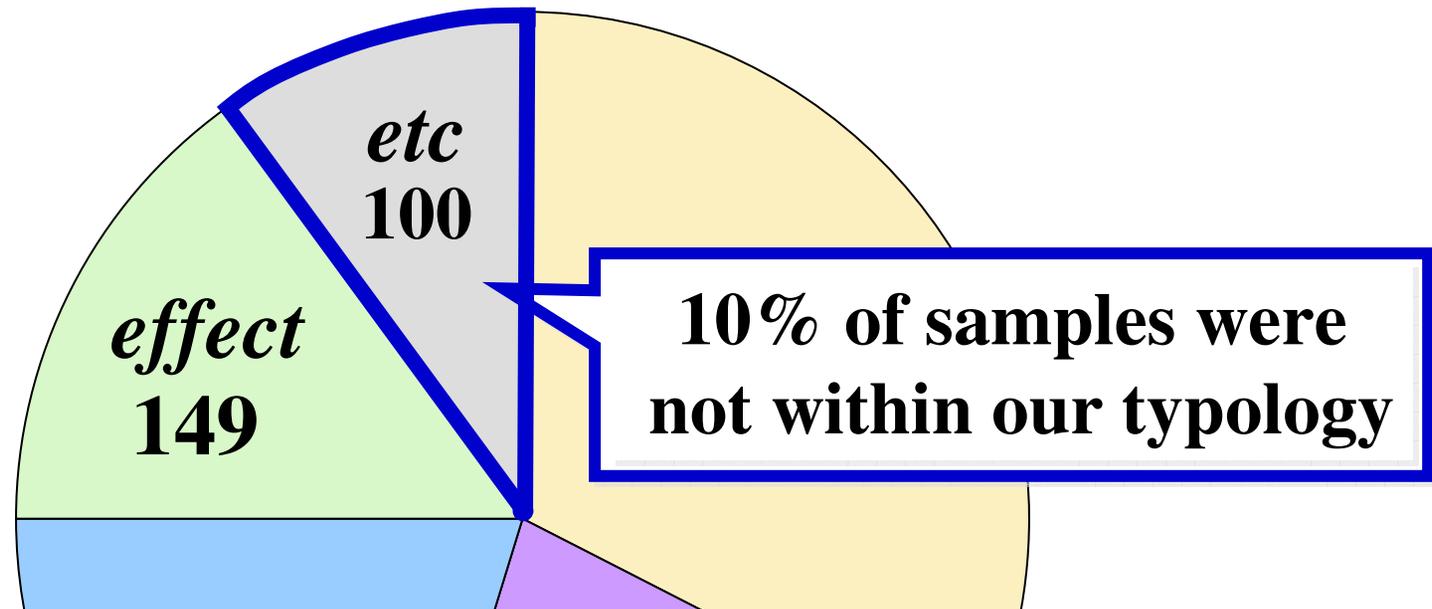

3. If the candidate sentence has the correct meaning, we identify the relation as belonging the category.

Results

Step 2

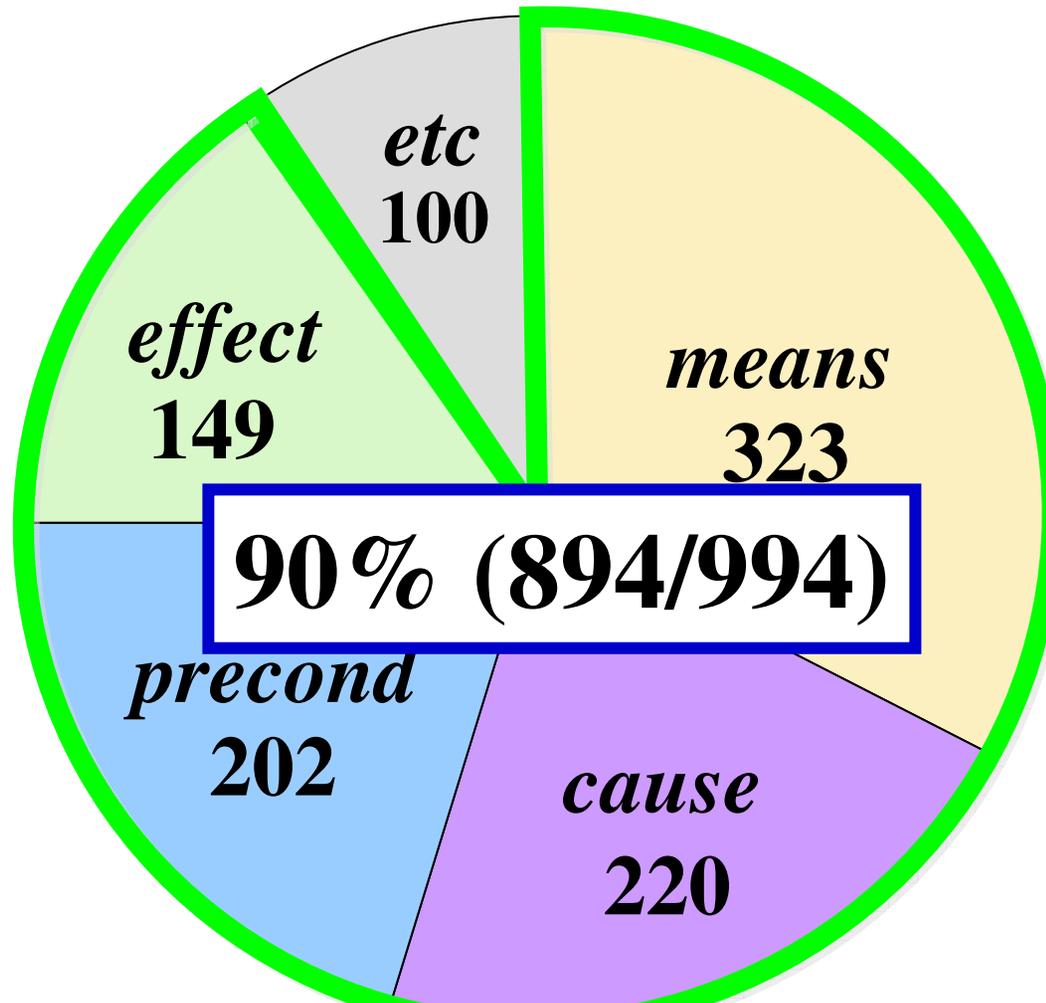

【Ex.】

hard disk-wo *kairyousuru-tame*
hard disk-ACC improve- tame

kaihatsu kyousou-ga *gekikasuru*
development competition-NOM intensify

Results

Step 2

- Each type of causal relation appeared with relatively similar frequency

Procedure

Step 1 Select markers.

We used “tame”

Step 2 Evaluate marker’s effectiveness.

applicable of 90% of samples

Step 3 Identify the causal relations automatically.

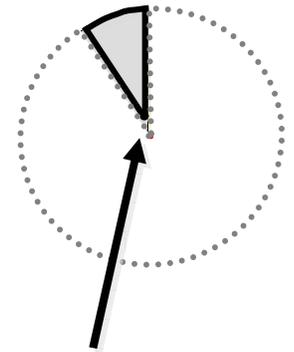

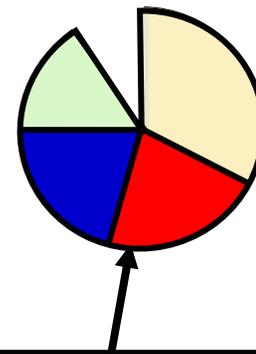

Step 3

Step 3

- Identify the causal relations automatically
 - Experiment using a machine learning approach

- Setting

- 5 classes: *cause, effect, precond, means* and *etc*
- SVMs / One vs. Rest method was applied
- Features

Features

Step 3

class		descriptions
Verb	EDR	Four conc
	ALT-J/E	A se dicti
	Goi-Taikei	Verl
Case	Marker	“ga
	Element	The
Modality	Tense	“-ru
	Aspect	“-te
	Voice	“-re
	Potential	“-de
	Negative	“-na
Subject		Wh
Event type		Agent’s volitional action or non-volitional state of affairs

Verb = [go: transitive, ⋯]

I went to a ticket office.

Tense = [past]

Event type = [Act]

Features: (Event type estimation)

Step 3

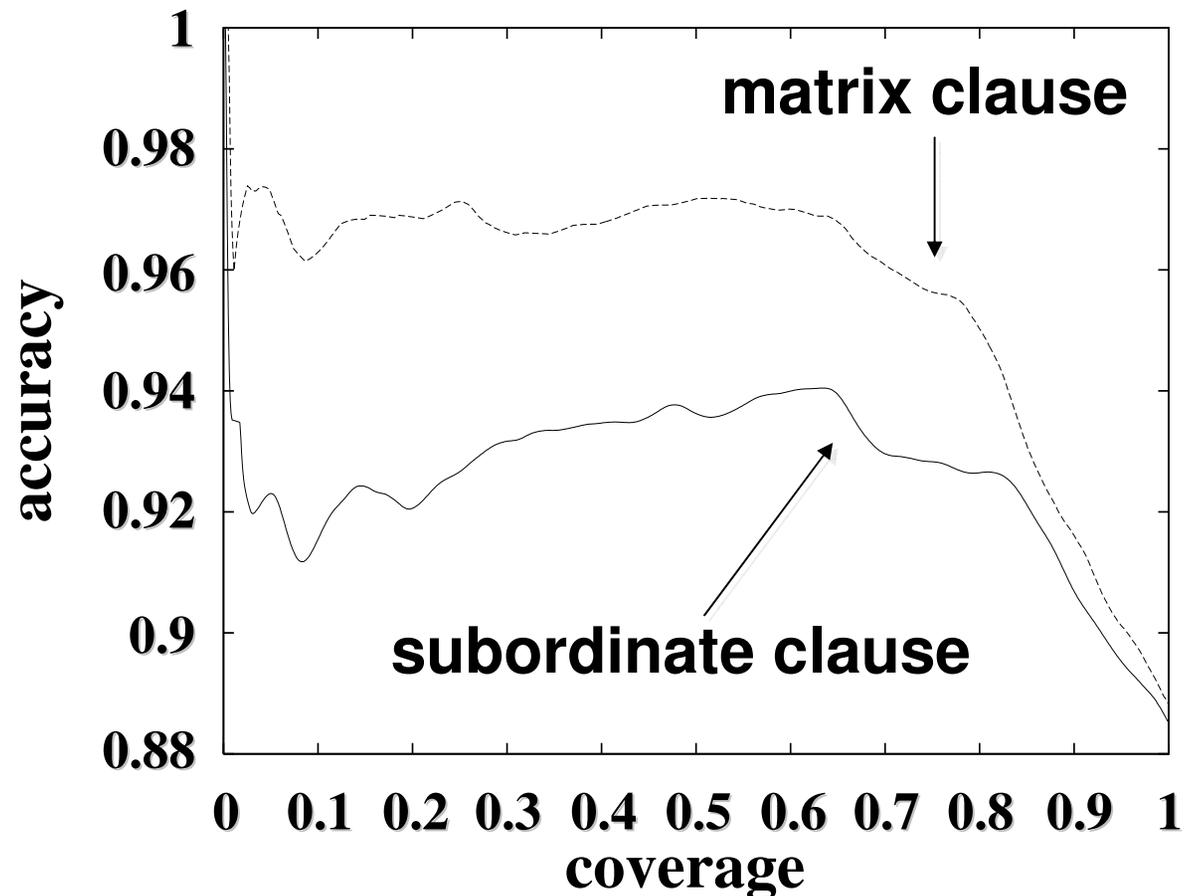

- Act: agent's volitional action
- SOA: non-volitional state of affairs

● Create

<i>Causal_rel</i> (arg1, arg2)
<i>cause</i> (<u>SOA</u> , <u>SOA</u>)
<i>effect</i> (<u>Act</u> , <u>SOA</u>)
<i>precond</i> (<u>SOA</u> , <u>Act</u>)
<i>means</i> (<u>Act</u> , <u>Act</u>)

necessary condit

Event ty

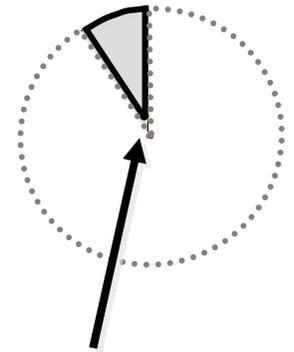

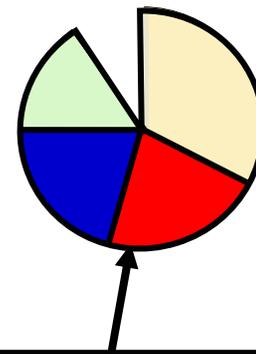

Step 3

Step 3

- Identify the causal relations automatically
- Experiment using a machine learning approach

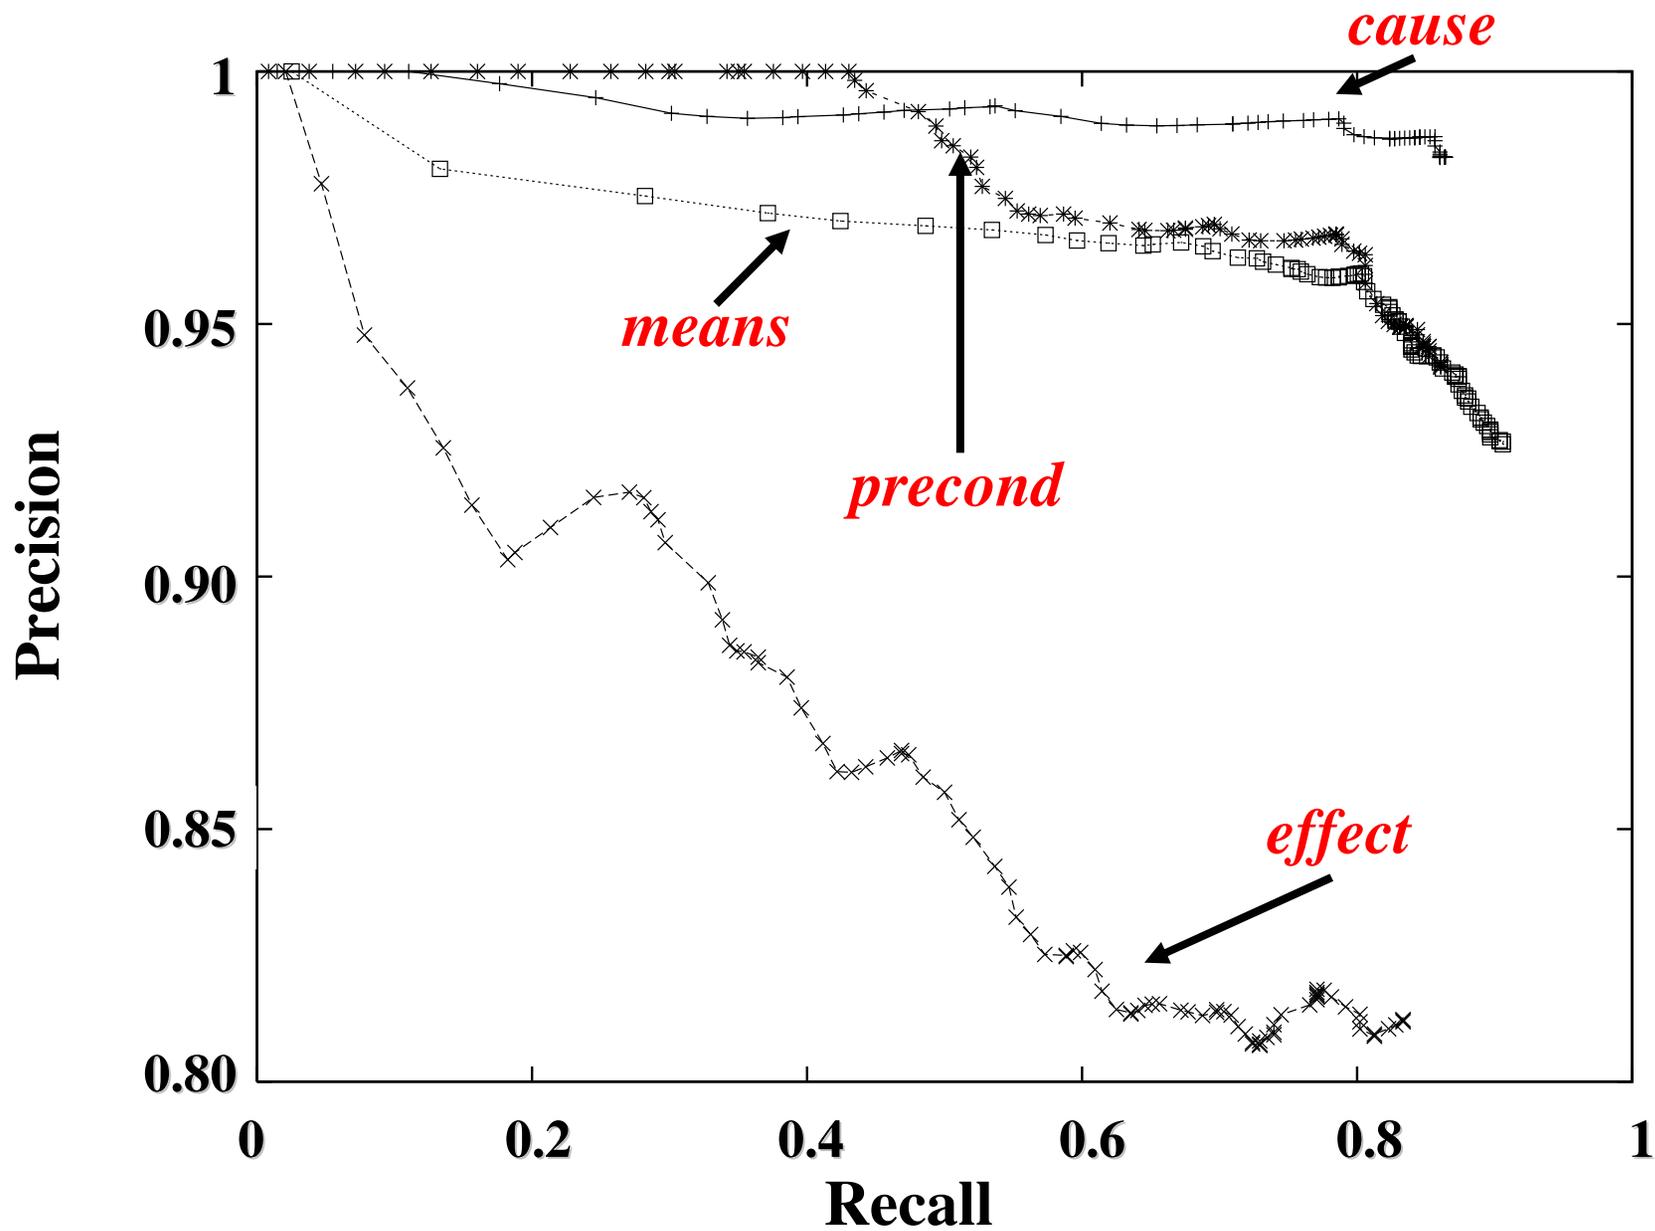

- Setting

- 5 classes: *cause, effect, precond, means* and *etc*
- SVMs / One vs. Rest method was applied
- Features
- Training: about 1000 sentences
- Evaluation: about 1000 new sentences

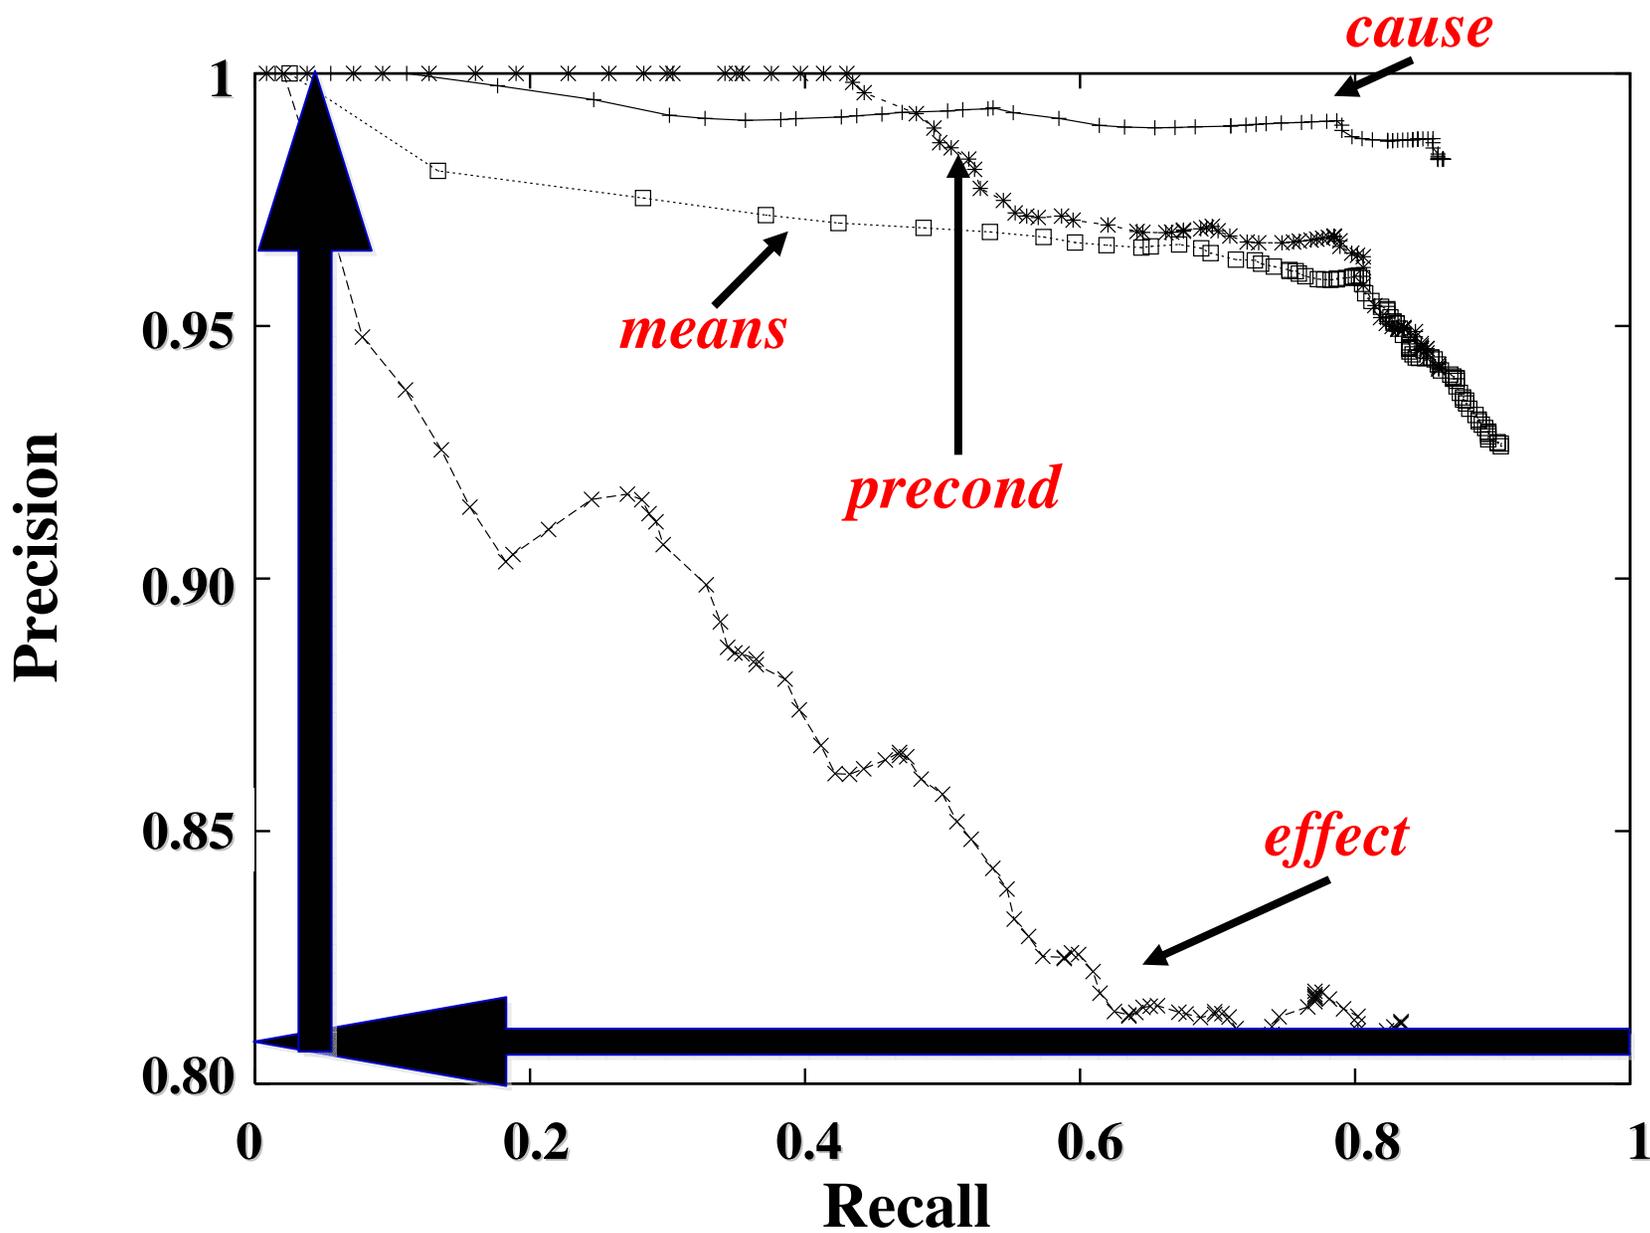

Results

Step 3

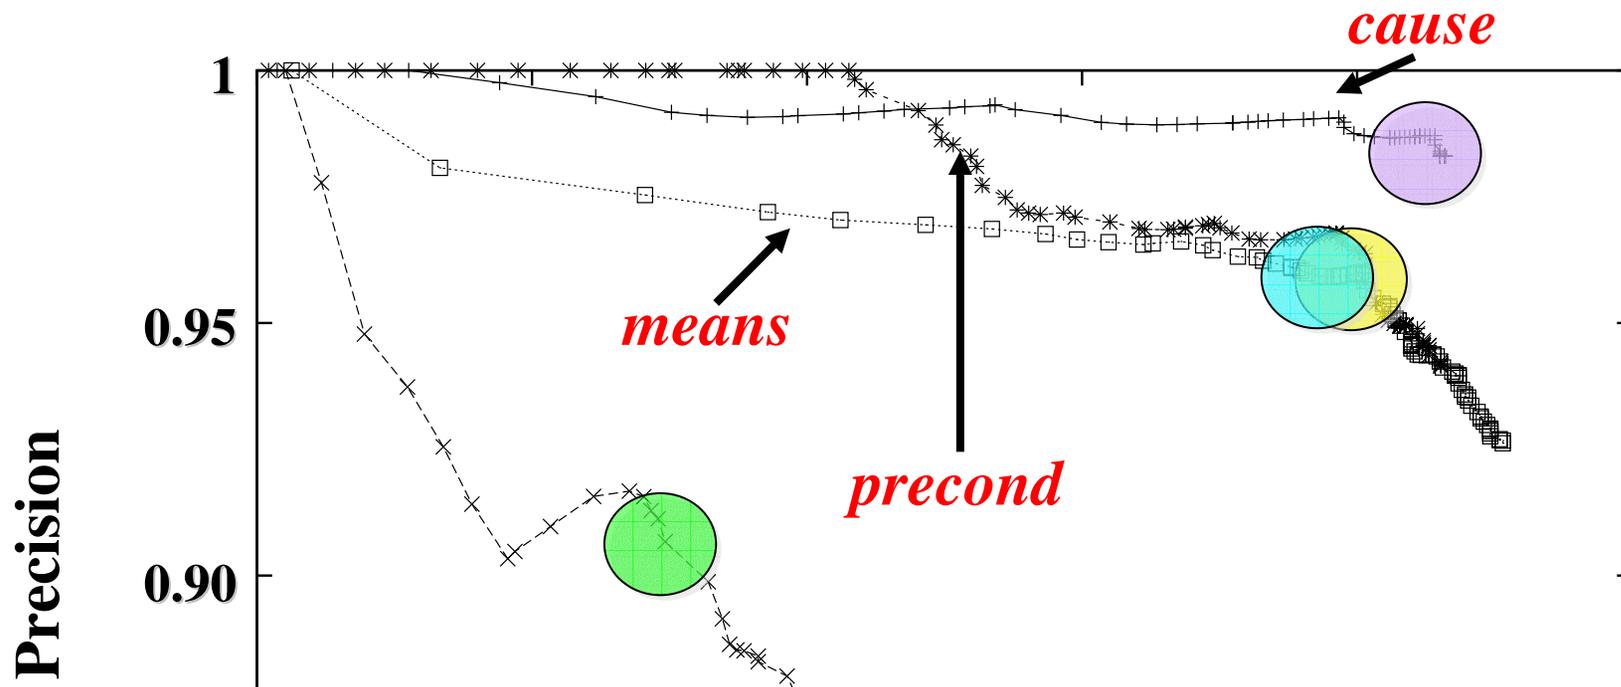

Results

Step 3

Results

Step 3

We expect to be able to acquire **over 27,000 causal relation instances** from one year of newspaper articles (i.e. 1.8% of all sentences).

Procedure

Step 1 Select markers.

We used “tame”

Step 2 Evaluate marker’s effectiveness.

applicable to 90% of samples

Step 3 Identify the causal relations automatically.

Accuracy was sufficiently high

Examples of causal relation instances

cause ({temperature stays high},
{coat sales are down})

precond ({house becomes cramped},
{someone moves into a larger house})

means ({someone undertakes intensive highway},
{someone reduces the number of crashes})

Examples of causal relation instances

- Abstraction
- Ellipsis & pronoun resolution

cause ({ the weather has been bad recently },
{ the plan is **5 days** behind schedule })

organization

numerical value

location

precond ({ **JBM** is continuing its move into **Asia** },
{ (ϕ) decides to produce **it there** })

ellipsis

pronoun

Conclusion

- We study automatic knowledge acquisition of causal relations from document collections.

● Findings

Procedure

- Step 1** Select markers. *we used "tame"*
- Step 2** Evaluate marker's effectiveness. *applicable to 90% of samples*
- Step 3** Identify the causal relations automatically. *accuracy was sufficiently high*

34

● Future work

Examples of causal relation instances

- Abstraction
- Ellipsis & pronoun resolution

cause ({the weather has been bad recently},
{the plan is 5 days behind schedule})

organization

numerical value

location

precond ({JBM is continuing its move into Asia},
{(ϕ) decides to produce it there})

ellipsis

pronoun
